I was looking for a simple way to make an existing Text Area form field expand as-and-when a user fills in enough information to reach to bottom edge of the form element.

James Padolsey has written a great little Auto resize function, you can get it from Github here: <https://github.com/padolsey/jquery.fn.autoResize>

The documentation in the example included with the download above is pretty good, but I've put up an example of it working here as well:
