Adobe keeps 'leaking' sneaky bits of information about the next platform release for Coldfusion Server, Version 9.

The latest release info is that it will be out of the box compatible with both Microsoft Office, and Open Office. This means that you will be able to read, write and create office documents from a coldfusion application.

Hand in hand with this is the new ability to talk directly to office documents is a new API for interfacing directly into SharePoint server, and update data directly. This is an interesting development for the ColdFusion community, as there really isn't any bespoke .Net functionality left that CF can't handle after this.
