

Incorrect error message reporting using CFFile action rename

Posted At : 1 September 2009 17:01 | Posted By : Shaun McCran

During a batch process that I was writing recently I was using a CFFile operation to rename some files.

When running it I came across this error message:

```
Attribute validation error for tag CFFILE.  
The value of the attribute source, which is currently "C:\fullUrl.jpg", is invalid
```

This is the calling cfml code. The actual variable values aren't important.

```
rename" source="#variables.tmpFileLocation#" destination="#variables.dir#/#variables
```

So I checked and double checked the source url, and manually browsed to the directory and viewed it. The file was right there! I had a wander around online and found that this isn't a new issue, but more a bad error report.

The error isn't actually relating to the 'source' attribute at all, but rather the 'destination' attribute. In this case it was a file/folder permissions problem. (I didn't have write access). It was simply a case of Coldfusion server reporting it incorrectly.
