

## Strongly typing data between flex and coldfusion

As part of an ongoing series of working out the best ways of passing data around from coldfusion to flex (and back again) I'm looking at the different formats of passing data into flex.

I've heard that you can "strongly type" the arguments and method names etc, and that allows for much easier passing of data back and forth.

I've not managed to find much about this online, so if you've got any ideas, please post them....

And I'll update as and when I make any discoveries!
